|                | Background: ERMAP is a single-pass type one membrane protein that belongs to the                 |
|                | immunoglobulin superfamily. Expressed in cord blood, fetal liver and adult bone marrow,          |
|                | ERMAP is thought to function as a cell adhesion molecule in erythroid cells and is responsible   |
|                | for expression of the Scianna/Radin (Sc/Rd) blood group antigen system. The Sc/Rd system is      |
|                | comprised of seven antigens that are present on the surface of red blood cells and have a        |
|                | variety of functions ranging from protein transport to cell adhesion. These seven blood antigens |
|                | can differ in their expression within a population and may sometimes differ between mother       |
|                | and child. A fetus expressing different blood antigens than its mother may cause the mother to   |
|                | produce against the fetal blood. This condition is known as hemolytic disease of the newborn     |
|                | (HDN) and is characterized by jaundice, anemia and in some cases, infant death.                  |
