Target Details

Background: Synonyms: DNA binding protein p96P, DNA-binding protein p96P, Glucocorticoid modulatory element binding protein 1, Glucocorticoid modulatory element-binding protein 1, GMEB 1, GMEB-1, Gmeb1, GMEB1_HUMAN, P96P, Parvovirus initiation factor p96, P 96, P p96, P96.

Background: GMEB-1 is a 573 amino acid protein that contains one SAND domain and is a member of the KDWK family of combinatorial transcription modulators. Localized to both the cytoplasm and the nucleus, GMEB-1 forms a heterodimer with GMEB-2 (Glucocorticoid modulatory element-binding protein 2) and, once associated with GMEB-2, plays a key role in parvovirus DNA replication. In addition, GMEB-1 functions alone as a trans-acting factor that, by binding to glucocorticoid modulatory elements (GMEs) in TAT (tyrosine aminotransferase) promoters, increases intracellular sensitivity to glucocorticoid concentrations. GMEB-1 also interacts with initiator procaspases and, via this interaction, can inhibit caspase-induced apoptosis. Due to alternative splicing events, GMEB-1 is expressed as two isoforms.
