Target Details

Target:	VAV3
Alternative Name:	VAV3 (VAV3 Products)
Background:	Synonyms: VAV3phospho Y141, Guanine nucleotide exchange factor VAV3, Protein vav 3,
	Protein vav3, VAV 3, Vav 3 guanine nucleotide exchange factor, VAV 3 oncogene, VAV 3 protein,
	VAV-3, Vav3, VAV3 oncogene, VAV3 protein, VAV3_HUMAN.
	Background: The Vav family of Rho guanine nucleotide exchange factors (GEFs) orchestrate
	signaling events following lymphocyte antigen receptor activation. Vav3, like Vav (also known
	as Vav1 or p95Vav), undergoes tyrosine phosphorylation downstream of T cell receptor cross-
	linkage, and subsequently interacts with 2 adaptor molecules, SLP76 and 3BP2. Following
	these events, however, the paths of Vav and Vav3 diverge, Vav affects IL-2 promotor activity,
	while Vav3 impacts gene transcription linked to serum response element (SRE). Furthermore,
	Vav3 expression follows a cell cycle-dependent pattern, with transient upregulation occuring
	during mitosis. Encforced Vav3 expression leads to the appearance of multinucleate cells,
	implicating a role for Vav3 in the control of cytokinesis.
Gene ID:	10451
Pathways:	Fc-epsilon Receptor Signaling Pathway, Neurotrophin Signaling Pathway
