Background:	Synonyms: Chorion-specic transcription factor GCMb, GCM mot protein 2, GCMb, Glial cells	
	missing homolog 2, glial cells missing homolog b, GCM2_HUMAN.	
	Background: Glial cells missing homolog 2 (GCM2), also known as Chorion-specific	
	transcription factor GCMb, is a 506 amino acid nuclear protein. GCM2 is a transcription factor	
	that acts as an essential regulator of parathyroid development. GCM2 is also thought to	
	mediate the effect of calcium on parathyroid hormone expression and secretion in parathyroid	
	cells. GCM2 contains one N-terminal GCM domain, which has DNA binding activity. Mutations	
	of the gene that encodes GCM2 are associated with hypoparathyroidism, an autosomal	
	recessive condition characterized by hypocalcemia and hyperphosphatemia.	
Gene ID:	9247
