Target Details

Alternative Name:	FMN1/Formin 1 (FMN1 Products)	
Background:	Synonyms: FMN, Formin 1, Formin 1, Formin 1, LD, Limb deformity protein homolog, FMN1_HUMAN.	
	Background: The temporal genetic hierarchy influencing normal limb development can	
	deregulate and mediate mammalian developmental syndromes. In mice, the limb deformity (ld)	
	locus influences normal limb development and gives rise to alternative mRNAs that can	
	translate into a family of proteins known as formins. Formins play a crucial role in cytoskeletal	
	reorganization by influencing Actin filament assembly. Formins co-localize with the actin	
	cytoskeleton and can translocate into the cell cytosol and into the nucleus in an HGF-dependent	
	manner. Vertebrate nuclear formins can control polarizing activity in limb buds through	
	establishment of a Sonic hedgehog/FGF-4 feedback loop. Deficiency mutations at the	
	mammalian Id locus lead to profound developmental defects in limb and kidney formation. The	
	human Formin 1 and 2 genes map to chromosome 15q13.3 and 1q43, respectively.
