	Background: Calcyclin, also known as Protein S100-A6, growth factor-inducible protein 2A9, S-
	100 calcium-binding protein A6 (S-100A6) or MLN 4, is a homodimeric member of the S-100
	calcium-binding protein family whose expression is upregulated in proliferating and
	differentiating cells. Calcyclin is inducible by growth factors and overexpressed in acute
	myeloid leukemias. It is expressed in a cell-specific manner in subpopulations of neurons and
	astrocytes and in epithelial cells and fibroblasts. Calcyclin is a specific target of S-100B protein
	in vivo. The binding of Calcyclin to S-100B is stabilized by S-100B-bound calcium and zinc.
	Calcyclin associates with both Annexin XI and CacyBP (calcyclin-binding protein). It functions to
	activate several processes along the calcium signal transduction pathway including the
	regulation of cell growth, proliferation, secretion and exocytosis.
