	Background: In eukaryotes, the phosphorylation and dephosphorylation of proteins on serine
	and threonine residues is an essential means of regulating a broad range of cellular functions
	including division, homeostasis and apoptosis. A group of proteins that are intimately involved
	in this process are the protein phosphatases. In general, the protein phosphatase (PP)
	holoenzyme is a trimeric complex composed of a regulatory subunit, a variable subunit and a
	catalytic subunit. Four major families of protein phosphatase catalytic subunit have been
	identified, designated PP1, PP2A, PP2B and PP2C. An additional protein phosphatase catalytic
	subunit, PPX (also known as PP4), is a putative member of a novel PP family. The PP2B family
	comprises subfamily members PP2B-A alpha, PP2B-A Beta and PP2B-A Gamma. Two
	additional regulatory subunits been identified, designated PP2B-B1 and PP2B-B2.
