	Background: The GGA family of proteins (Golgi-localized, g-Adaptin ear-containing, ARF-binding
	proteins) are ubiquitous coat proteins that facilitate the trafficking of soluble proteins from the
	trans-Golgi network (TGN) to endosomes/lysosomes by means of interactions with TGN-
	sorting receptors, ARF (ADP-ribosylation factor), and clathrin. Members of the GGA family,
	GGA1,GGA2 (also known as VEAR) and GGA3, are multi-domain proteins that bind mannose 6-
	phosphate receptors (MPRs). GGAs have modular structures with an N-terminal VHS (VPS27,
	Hrs and STAM) domain followed by a GAT (GGA and Tom1) domain, a connecting hinge
	segment and a C-terminal GAE (g-Adaptin ear) domain. The amino-terminal VHS domains of
	GGAs form complexes with the cytoplasmic domains of sorting receptors by recognizing
	acidic-cluster di-leucine (ACLL) sequences. The human GGA3 gene maps to chromosome 17
	and encodes a 723 amino acid protein that shares 46 % sequence identity with GGA1 and 38 $\%$
	with GGA2.
