Target Details	
Target:	PINK1
Alternative Name:	PINK1 (PINK1 Products)
Background:	PINK1 (PTEN induced putative kinase 1) is a mitochondrial serine/threonine kinase which
	maintains mitochondrial function/integrity, provides protection against mitochondrial
	dysfunction during cellular stress, potentially by phosphorylating mitochondrial proteins, and is
	involved in the clearance of damaged mitochondria via selective autophagy (mitophagy). PINK1
	is synthesized as a 63 kD protein which undergoes proteolyt processing to generate at least
	two cleaved forms (55 kD and 42 kD). PINK1 and its substrates have been found in the cytosol
	as well as in different sub-mitochondrial compartments, and according to the recent reports,
	PINK1 may be targeted to OMM (outer mitochondrial membrane) with its kinase domain facing
	the cytosol, providing a possible explanation for the observed physical interaction with the
	cytosolic E3 ubiquitin ligase Parkin. Defective PINK1 may cause alterations in processing,
	stability, localization and activity as well as binding to substrates/interaction-partners which
	ultimately leads to differential effects on mitochondrial function and morphology. Mutations in
	PINK1 are linked to autosomal recessive early onset Parkinson's disease, and are associated
	with loss of protective function, mitochondrial dysfunction, aggregation of alpha-synuclein, as
	well as proteasome dysfunction.
