## Target Details

Background:	This gene encodes a cysteine protease that has a strict specificity for hydrolysis of asparaginyl
	bonds. This enzyme may be involved in the processing of bacterial peptides and endogenous
	proteins for MHC class II presentation in the lysosomal/endosomal systems. Enzyme
	activation is triggered by acidic pH and appears to be autocatalytic. Protein expression occurs
	after monocytes differentiate into dendritic cells. A fully mature, active enzyme is produced
	following lipopolysaccharide expression in mature dendritic cells. Overexpression of this gene
	may be associated with the majority of solid tumor types. This gene has a pseudogene on
	chromosome 13. Several alternatively spliced transcript variants have been described, but the
	biological validity of only two has been determined. These two variants encode the same
	isoform.
