## Target Details

Production of Molecular Mediator of Immune Response, BCR Signaling

Application Notes:	Recommended Dilution for serum and plasma samples2 - 10 fold
Sample Volume:	100 μL
Plate:	Pre-coated
Protocol:	1. Prepare all reagents, samples and standards as instructed in the manual.
	2. Add 100 $\mu L$ of standard or sample to each well.
	3. Incubate 2.5 h at RT or O/N at 4 °C.
	4. Add 100 $\mu$ L of prepared biotin antibody to each well.
	5. Incubate 1 h at RT.
	6. Add 100 μL of prepared Streptavidin solution to each well.
	7. Incubate 45 min at RT.
	8. Add 100 μL of TMB One-Step Substrate Reagent to each well. 9. Incubate 30 min at RT.
	10. Add 50 $\mu$ L of Stop Solution to each well.
	11. Read at 450 nm immediately.
Reagent Preparation:	1. Bring all reagents and samples to room temperature (18 - 25 °C) before use. 2. Sample
	dilution: If your samples need to be diluted, Assay Diluent C (Item L) should be used for dilution
	of serum/plasma/culture supernatants. The Mouse Fcgamma RIIB ELISA Kit Protocol 3
	Suggested dilution for normal serum/plasma: 2-10 fold*. * Please note that levels of the target
	protein may vary between different specimens. Optimal dilution factors for each sample must
	be determined by the investigator. 3. Assay Diluent B (Item E) should be diluted 5-fold with
	deionized or distilled water before use. 4. Preparation of standard: Briefly spin the vial of Item C
	Add 400 µL Assay Diluent C (Item L) into Item C vial to prepare a 200 ng/ml standard solution.
	Dissolve the powder thoroughly by a gentle mix. Add 210 $\mu$ L standard (200 ng/ml) from the vial
	of Item C, into a tube with 390 $\mu$ L Assay Diluent C to prepare a 70 ng/ml standard solution.
	Pipette 400myl Assay Diluent C into each tube. Use the 70 ng/ml standard solution to produce
	a dilution series (shown below). Mix each tube thoroughly before the next transfer. Assay
	Diluent C serves as the zero standard (0 ng/ml). 200 $\mu$ L 200 myl

	use. Add 100 µL of 1x Assay Diluent B (Item E) into the vial to prepare a detection antibody concentrate. Pipette up and down to mix gently (the concentrate can be stored at 4 °C for 5 days). The detection antibody concentrate should be diluted 80-fold with 1x Assay Diluent B and used in step 4 of Part VI Assay Procedure. 7. Briefly spin the HRP-Streptavidin concentrate vial (Item G) and pipette up and down to mix gently before use. HRP-Streptavidin concentrate should be diluted 600-fold with 1x Assay Diluent B (Item E). For example: Briefly spin the vial (Item G) and pipette up and down to mix gently . Add 20 µL of HRP-Streptavidin concentrate into a tube with 12 mL 1x Assay Diluent B to prepare a 600-fold diluted HRP-Streptavidin solution (don't store the diluted solution for next day use). Mix well.
Assay Procedure:	<ul> <li>1. Bring all reagents and samples to room temperature (18 - 25 °C) before use. It is recommended that all standards and samples be run at least in duplicate. 2. Add 100 μL of each standard (see Reagent Preparation step 2) and sample into appropriate wells. Cover well and incubate for 2.5 hours at room temperature or over night at 4 °C with gentle shaking. 3. Discard blot it against clean paper towels. 4. Add 100 μL of 1x prepared biotinylated antibody (Reagent Preparation step 6) to each well. Incubate for 1 hour at room temperature with gentle shaking. 5. Discard the solution. Repeat the wash as in step 3. 6. Add 100 μL of prepared Streptavidin solution (see Reagent Preparation step 7) to each well. Incubate for 45 minutes at room temperature with gentle shaking. 7. Discard the solution. Repeat the wash as in step 3. 8. Add 100 μL of TMB One-Step Substrate Reagent (Item H) to each well. Incubate for 30 minutes at room temperature in the dark with gentle shaking. 9. Add 50 μL of Stop Solution (Item I) to each well. Read at 450 nm immediately.</li> </ul>
Calculation of Results:	Calculate the mean absorbance for each set of duplicate standards, controls and samples, and subtract the average zero standard optical density. Plot the standard curve on log-log graph paper or using Sigma plot software, with standard concentration on the x-axis and absorbance on the y-axis. Draw the best-fit straight line through the standard points.
