| | Background: The claudin superfamily consists of many structurally related proteins in humans. |
| | These proteins are important structural and functional components of tight junctions in |
| | paracellular transport. Claudins are located in both epithelial and endothelial cells in all tight |
| | junction-bearing tissues. Three classes of proteins are known to localize to tight junctions, |
| | including the claudins, Occludin and junction adhesion molecules. Claudins, which consist of |
| | four transmembrane domains and two extracellular loops, make up tight junction strands. |
| | Claudin expression is often highly restricted to specfic regions of different tissues and may |
| | have an important role in transcellular transport through tight junctions. Claudin-10 is a 228 |
| | amino acid multi-pass membrane protein that belongs to the claudin family and plays an |
| | important role in cell-adhesion activity and tight junction-specific events. |
