## Target Details

|                     | Background: Plays a major role in tight junction-specific obliteration of the intercellular space,<br>through calcium-independent cell-adhesion activity. Involved in paracellular magnesium<br>reabsorption. Required for a selective paracellular conductance. May form, alone or in<br>partnership with other constituents, an intercellular pore permitting paracellular passage of<br>magnesium and calcium ions down their electrochemical gradients. Alternatively, it could be a<br>sensor of magnesium concentration that could alter paracellular permeability mediated by<br>other factors. |
