	cytoplasmic, 8 kDa dynein light chain, Dynein light chain LC8-type 1, Protein inhibitor of	
	neuronal nitric oxide synthase, DYNLL1	
	Background: Acts as one of several non-catalytic accessory components of the cytoplasmic	
	dynein 1 complex that are thought to be involved in linking dynein to cargos and to adapter	
	proteins that regulate dynein function. Cytoplasmic dynein 1 acts as a motor for the intracellular retrograde motility of vesicles and organelles along microtubules. May play a role in changing or maintaining the apatiel distribution of autoekeletal structures. Diada and inhibits the	
	changing or maintaining the spatial distribution of cytoskeletal structures. Binds and inhibits the	
	catalytic activity of neuronal nitric oxide synthase. Promotes transactivation functions of ESR1	
	and plays a role in the nuclear localization of ESR1. Regulates apoptotic activities of BCL2L11	
	by sequestering it to microtubules. Upon apoptotic stimuli the BCL2L11-DYNLL1 complex	
	dissociates from cytoplasmic dynein and translocates to mitochondria and sequesters BCL2 thus neutralizing its antiapoptotic activity.
