protein coupled receptor 37-like 1, GPR37L1, ETBR2_HUMAN.
Background: G-protein coupled receptor. Has been shown to bind the neuroprotective and
glioprotective factor prosaposin (PSAP), leading to endocytosis followed by an ERK
phosphorylation cascade. However, other studies have shown that prosaposin does not
increase activity. It has been suggested that GPR37L1 is a constitutively active receptor which
signals through the guanine nucleotide-binding protein G(s) subunit alpha. Participates in the
regulation of postnatal cerebellar development by modulating the Shh pathway. Regulates
baseline blood pressure in females and protects against cardiovascular stress in males.
Mediates inhibition of astrocyte glutamate transporters and reduction in neuronal N-methyl-D-
aspartate receptor activity.
