|  | Background: Transmembrane adapter protein which associates with KLRK1 to form an activation receptor KLRK1-HCST in lymphoid and myeloid cells, this receptor plays a major role |
|  | in triggering cytotoxicity against target cells expressing cell surface ligands such as MHC class |
|  | I chain-related MICA and MICB, and UL16-binding proteins (ULBPs), these ligands are up- |
|  | regulated by stress conditions and pathological state such as viral infection and tumor |
|  | transformation. Functions as docking site for PI3-kinase PIK3R1 and GRB2. Interaction of |
|  | ULBPs with KLRK1-HCST triggers calcium mobilization and activation of the PIK3R1, |
|  | MAP2K/ERK, and JAK2/STAT5 signaling pathways. Both PIK3R1 and GRB2 are required for full |
|  | KLRK1-HCST-mediated activation and ultimate killing of target cells. In NK cells, KLRK1-HCST |
|  | signaling directly induces cytotoxicity and enhances cytokine production initiated via |
|  | DAP12/TYROBP-associated receptors. In T-cells, it provides primarily costimulation for TCR- |
|  | induced signals. KLRK1-HCST receptor plays a role in immune surveillance against tumors and |
|  | is required for cytolysis of tumors cells, indeed, melanoma cells that do not express KLRK1 |
|  | ligands escape from immune surveillance mediated by NK cells. |
