	antigen 3.4, MAGE-B6 antigen, MAGEB6
	Background: This gene is a member of the MAGEB gene family. The members of this family
	have their entire coding sequences located in the last exon, and the encoded proteins show 50
	to 68 $\%$ sequence identity to each other. The promoters and first exons of the MAGEB genes
	show considerable variability, suggesting that the existence of this gene family enables the
	same function to be expressed under different transcriptional controls. This gene is expressed
	in testis, and in a significant fraction of tumors of various histological types. The MAGEB genes
	are clustered on chromosome Xp22-p21. [provided by RefSeq, Jul 2008]
