| | Background: Protocadherins are a large family of cadherin-like cell adhesion proteins that are | |
| | involved in the establishment and maintenance of neuronal connections in the brain. There are | |
| | three protocadherin gene clusters, designated alpha, beta and gamma, all of which contain | |
| | multiple tandemly arranged genes. PCDH21 (protocadherin 21), also known as PRCAD, is an | |
| | 859 amino acid single-pass membrane protein that localizes to the outer segments of | |
| | photoreceptor cells and contains six cadherin domains. Existing as multiple alternatively | |
| | spliced isoforms, PCDH21 functions as a calcium-dependent cell adhesion protein that is | |
| | thought to be required for the structural integrity of photoreceptor cells and may be involved in | |
| | the formation and maintenance of neuronal networks. | |
