	Background: Fyn is a membrane-associated, non-receptor protein tyrosine kinase
	approximately 59 kDa, which belongs to the Src family of cytoplasmic tyrosine kinases. Fyn is
	very strongly similar to mouse Fyn, v-yes and c-src. Fyn is expressed predominately in tissues
	of neuronal and hematopoietic origin. Neuronal Fyn and hematopoietic Fyn differ at the junctic
	of the SH2 and kinase domains due to tissue specific alternative splicing. Fyn has been shown
	to be involved in B cell and T cell activation as well as keratinocyte differentiation. In T cells, Fy
	associates with the T-cell antigen receptor and Thy1. The unique N terminal domain of Fyn
	interacts with the CD3 and eta chains of the TcR. Fyn can bind to other proteins (p82 and p116
	through its SH2 and SH3 domains, which may act as substrates or regulators of Fyn activity.
	Fyn is highly expressed in brain suggesting that it may have a role in the sensory nervous
	network and in myelination at early stages of CNS formation.
