Target Details

Background:	ErbB3,also known as Her3 (human epidermal growth factor receptor 3), is a member of the
	epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases. This membrane-
	bound glycoprotein has a neuregulin binding domain but has not an active kinase domain. It
	therefore can bind the ligand but cannot mediate the intracellular signal transduction through
	protein phosphorylation. However, it does form heterodimers with ErbB2 or other EGFR
	members responsible for tyrosine phosphorylation to give a receptor complex and initiate the
	related pathway, which lead to cell proliferation or differentiation. Overexpression of this protein
	has been reported in numerous cancers, including prostate, bladder, and breast tumors. This
	protein has different isoforms derived from alternative splicing variants, and among which, the
	secreted isoform lacking the intermembrane region modulates the activity of membrane-bound
	form.
Molecular Weight:	70.5 kDa
NCBI Accession:	NP_001973
Pathways:	RTK Signaling, Fc-epsilon Receptor Signaling Pathway, EGFR Signaling Pathway, Neurotrophin Signaling Pathway
