Target Details	
Alternative Name:	HCV Core Protein (HCV C Products)
Target Type:	Viral Protein
Background:	Hepatitis C virus (HCV) is a small (55-65 nm in size), enveloped, positive sense single-stranded
	RNA virus in the family Flaviviridae and the principal cause of parenteral non-A, non-B hepatitis.
	The virus genome consists of a single open reading frame of approximately 9.4 kb which
	encodes a single polyprotein of about 3,010 amino acids. The polyprotein is processed by host
	cell and viral proteases into four structural proteins (core, envelope1 and 2, and p7) and six non-
	structural proteins (NS2, 3, 4a, 4b, 5a, and 5b) necessary for viral replication. HCV core protein
	(191 aa) is not only a component of nucleocapsid but also has multiple functions and is
	thought to be a pathogenic factor for hepatitis. It also participates in some cellular processes,
	including transcriptional regulation and cellular transduction. HCV core antigen is used as
	diagnostic marker for HCV infection.
