Target Details

| Background: | Brevican is the most abundant chondroitin sulfate proteoglycan in the extracellular matrix of |
|---------------------|--------------------------------------------------------------------------------------------------|
| | the adult brain. It is a member of the lectican family of aggregating extracellular matrix |
| | proteoglycans that bear chondroitin sulfate (CS) chains. It is highly expressed in the central |
| | nervous system and is thought to stabilize synapses and inhibit neural plasticity. Brevican is |
| | secreted from astrocytes and neurons as a 145 kD core protein that bears up to three, |
| | covalently-linked, CS chains. It is also is secreted as a 145 kD core protein without CS chains. |
| | When cleaved by extracellular glutamyl endopeptidases, the ADAMTSs, a 55 kD N-terminal |
| | fragment is formed that contains the unique C terminal epitope EAMESE. |
