known as SERPINH1, a serine proteinase inhibitor. It is a stress protein that resides in the
endoplasmic reticulum, has an active role on the intracellular process of folding, assembly and
secretion of pro-collagens. Recent studies have shown the association of on an increased
expression of HSP47 around fibrotic lesions (1). The identification of a novel biomarker on cell
therapies aimed to reduce the progression of fibrotic diseases, could be used potentially as a
universal marker, since HSP47 binds a single substrate (2). Type I collagen is fundamental
during the healing process after a myocardial infarction. It is critical in the position of collagen-
produced cells and the assembly of collagen fibrils (3).
