Target Details

Alternative Name:	PSD95 (DLG4 Products)	
Background:	Postsynaptic Density protein 95 (PSD95), also known as Synapse associated protein 90 kDa, is	
	a member of the membrane-associated guanylate kinase (MAGUK) family of proteins. PSD95 is	
	a scaffolding protein and is involved in the assembly and function of the postsynaptic density	
	complex (1). These family members consist of an N-terminal variable segment followed by	
	three amino-terminal PDZ domains, an upstream SH3 domain and an inactive carboxyl-termina	
	guanylate kinase (GK) domain. The first and second PDZ domain localize NMDA receptors and	
	K+ channels to synapses, and the third binds to neuroligins which are neuronal cell adhesion	
	molecules that interact with b-neurexins and form intercellular junctions. PSD-95 also binds to	
	neuronal nitric oxide synthase, possibly through interactions between PDZ domains present on	
	both proteins (2). Thus different PDZ domains of PSD-95 might be specialized for distinct	
	functions (3, 4). PSD95 participates in synaptic targeting of AMPA receptors through an indirect	
	manner involving Stargazin and related transmembrane AMPA receptor regulatory proteins	
	(TARPs) (5). The protein is implicated in experience dependent plasticity and plays an	
	indispensable role in learning (6). Mutations in PSD95 are associated with autism (7).
