Target Details

Alternative Name:	PSD95 (DLG4 Products)
Background:	Postsynaptic Density protein 95 (PSD95), also known as Synapse associated protein 90 kDa, is
	a member of the membrane-associated guanylate kinase (MAGUK) family of proteins. PSD95 is
	a scaffolding protein and is involved in the assembly and function of the postsynaptic density
	complex (1). These family members consist of an N-terminal variable segment followed by
	three amino-terminal PDZ domains, an upstream SH3 domain and an inactive carboxyl-termina
	guanylate kinase (GK) domain. The first and second PDZ domain localize NMDA receptors and
	K+ channels to synapses, and the third binds to neuroligins which are neuronal cell adhesion
	molecules that interact with b-neurexins and form intercellular junctions. PSD-95 also binds to
	neuronal nitric oxide synthase, possibly through interactions between PDZ domains present on
	both proteins (2). Thus different PDZ domains of PSD-95 might be specialized for distinct
	functions (3, 4). PSD95 participates in synaptic targeting of AMPA receptors through an indirec-
	manner involving Stargazin and related transmembrane AMPA receptor regulatory proteins
	(TARPs) (5). The protein is implicated in experience dependent plasticity and plays an
	indispensable role in learning (6). Mutations in PSD95 are associated with autism (7).
