	cochaperone for the HSP90 chaperoning system (1). Studies have revealed that p23 is a small
	protein (18 to 25 kDa) with a simple structure (2, 3). p23 is a phosphor-protein, which is highly
	acidic and has an aspartic acid-rich c-terminal domain (1). Numerous studies have found p23
	to be associated with other client proteins like Fes tyrosine kinase (4), the heme regulated
	kinase HRI (5), hsf1 transcription factor (4), aryl hydrocarbon receptor (4), telomerase (6), and
	Hepadnavirus reverse transcriptase (7). In spite of several years of study, the exact functional
	significance of p23 is still not clear (8). p23 is thought to be involved in the adenosine
	triphosphate-mediated HSP90 binding of client proteins (8). Since many HSP90 client proteins
	are involved in oncogenic survival signaling, a recent study has concluded p23 to be a
	promising target in leukemic apoptosis (9). HSP90 and its co-chaperone p23 are certainly
	among the emerging anti-tumor targets in oncology. Specifically TSP23 (transcript similar p23)
	displays 44 % and 17 % amino acid identity with p23 and Sba1p respectively (10).
