# Target Details

Target:	ATP7B	
Alternative Name:	ATP7B (ATP7B Products)	
Background:	The copper efflux transporters ATP7A and ATP7B sequester intracellular copper into the	
	vesicular secretory pathway for export from the cell. ATP7b is an important protein for copper	
	transport and elimination of excess copper from the body. ATP7b transports metals in and out	
	of cells using ATP. There are 3 known isoforms of the ATP7b gene, A is found in the liver,	
	kidney, and brain, the shorter form B is found in brain tissue, and the third isoform, known as	
	WND/140 KDA is found in mitochondria. Mutations in the ATP7b gene can cause Wilson's	
	disease, an inherited disorder causing copper poisoning in the brain and liver, characterized by	
	neurological symptoms and hepatic damage.	
Gene ID:	540	
NCBI Accession:	NP_000044	
UniProt:	B7ZLR4
