Target Details

Background:	Aquaporins selectively conduct water molecules in and out of the cell, while preventing the
	passage of ions and other solutes. Known as water channels, they are integral membrane pore
	proteins (1, 2). Aquaporin 2 is the vasopressin-regulated water channel of the apical membrane
	of collecting duct cells. It is located in kidney epithelial cells and usually lies dormant in
	intracellular vesicle membranes. When it is needed vasopressin binds to the cell surface
	vasopressin receptor, activating a signaling pathway that cause AQP2 containing vesicles to
	fuse with the plasma membrane so the AQP2 can be used by the cell (3). Defects in AQP2 area
	cause of an autosomal dominant form of nephrogenic diabetes insipidus (NDI) (4).
Gene ID:	25386
