## Target Details

Background:	The Epithelial Sodium Channel (ENaC) is a membrane ion channel permeable to Na+ ions. It is
	located in the apical plasma membrane of epithelia in the kidneys, lung, colon, and other tissues
	where it plays a role in trans epithelial Na+-ion transport (1). Specifically Na+ transport via ENaC
	occurs across many epithelial surfaces, and plays a key role in regulating salt and water
	absorption (2). ENaCs are composed of three structurally related subunits that form a
	tetrameric channel, $\alpha,\beta,$ and $\gamma.$ The expression of its alpha and beta subunits is enhanced as
	keratinocytes differentiate (3, 4). The beta and gamma-ENaC subunits are essential for edema
	fluid to exert its maximal effect on net fluid absorption by distal lung epithelia(5). And it has
	been concluded that the subunits are differentially expressed in the retina of mice with ocular
	hypertension, therefore the up-regulation of alpha-ENaC proteins could serve as a protection
	mechanism against elevated intraocular pressure (6).
