Application Details	
Application Notes:	Optimal working dilution should be determined by the investigator.
Sample Volume:	100 μL
Assay Time:	3.5 h
Plate:	Pre-coated
Protocol:	Human Interleukin 21 (IL-21) ELISA Assay Kit employs the quantitative sandwich enzyme
	immunoassay technique. A monoclonal antibody specific for IL-21 has been pre-coated onto a
	microplate. Standards and samples are pipetted into the wells and any IL-21 present is bound
	by the immobilized antibody. Following incubation unbound samples are removed during a
	wash step, and then a detection antibody specific for IL-21 is added to the wells and binds to
	the combination of capture antibody- IL-21 in sample. Following a wash to remove any
	unbound combination, and enzyme conjugate is added to the wells. Following incubation and
	wash steps a substrate is added. A colored product is formed in proportion to the amount of IL-
	21 present in the sample. The reaction is terminated by addition of acid and absorbance is
	measured at 450nm. A standard curve is prepared from seven IL-21 standard dilutions and IL-
	21 sample concentration determined.
