Background:	This gene encodes a member of the cytochrome P450 superfamily of enzymes. The
	cytochrome P450 proteins are monooxygenases which catalyze many reactions involved in
	drug metabolism and synthesis of cholesterol, steroids and other lipids. This protein localizes
	to the mitochondrial inner membrane and catalyzes the conversion of cholesterol to

	pregnenolone, the first and rate-limiting step in the synthesis of the steroid hormones. Two
	transcript variants encoding different isoforms have been found for this gene. The cellular
	location of the smaller isoform is unclear since it lacks the mitochondrial-targeting transit
	peptide.
