Target Details	
Target:	Cytohesin 2 (CYTH2)
Alternative Name:	Cytohesin 2 (CYTH2 Products)
Background:	The protein encoded by this gene is a member of the PSCD family. Members of this family have identical structural organization that consists of an N-terminal coiled-coil motif, a central Sec7
	domain, and a C-terminal pleckstrin homology (PH) domain. The coiled-coil motif is involved in homodimerization, the Sec7 domain contains guanine-nucleotide exchange protein (GEP)

Target Details

activity, and the PH domain interacts with phospholipids and is responsible for association of PSCDs with membranes. Members of this family appear to mediate the regulation of protein sorting and membrane trafficking. The encoded protein exhibits GEP activity in vitro with ARF1, ARF3, and ARF6 and is 83 % homologous to CYTH1. Two transcript variants encoding different isoforms have been found for this gene.
