Target Details	
Target:	CACNA2D2
Alternative Name:	Cacna2d2 (CACNA2D2 Products)
Background:	Calcium channels mediate the entry of calcium ions into the cell upon membrane polarization.
	This gene encodes the alpha-2/delta subunit of the voltage-dependent calcium channel
	complex. The complex consists of the main channel-forming subunit alpha-1, and auxiliary
	subunits alpha-2/delta, beta, and gamma. The auxiliary subunits function in the assembly and

	membrane localization of the complex, and modulate calcium currents and channel
	activation/inactivation kinetics. The subunit encoded by this gene undergoes post-translational
	cleavage to yield the extracellular alpha2 peptide and a membrane-anchored delta polypeptide.
	This subunit is a receptor for the antiepileptic drug, gabapentin. Mutations in this gene are
	associated with early infantile epileptic encephalopathy. Single nucleotide polymorphisms in
	this gene are correlated with increased sensitivity to opioid drugs. Alternative splicing results in
	multiple transcript variants encoding different isoforms.
