Background:	Calpains are ubiquitous, well-conserved family of calcium-dependent, cysteine proteases. The calpain proteins are heterodimers consisting of an invariant small subunit and variable large subunits. The large subunit possesses a cysteine protease domain, and both subunits possesses calcium-binding domains. Calpains have been implicated in neurodegenerative processes, as their activation can be triggered by calcium influx and oxidative stress. The protein encoded by

	this gene is highly expressed in the placenta. Its C-terminal region lacks any homology to the
	calmodulin-like domain of other calpains. The protein lacks critical active site residues and thus
	is suggested to be proteolytically inactive. The protein may play a role in tumor formation by
	inhibiting apoptosis and promoting angiogenesis.
