DNA binding by alpha subunit as the complex binds to the core site of various enhancers and
promoters, including murine leukemia virus, polyomavirus enhancer, T-cell receptor enhancers
and GM-CSF promoters. Alternative splicing generates two mRNA variants, each encoding a
distinct carboxyl terminus. In some cases, a pericentric inversion of chromosome 16
[inv(16)(p13q22)] produces a chimeric transcript consisting of the N terminus of core-binding
factor beta in a fusion with the C-terminal portion of the smooth muscle myosin heavy chain
11. This chromosomal rearrangement is associated with acute myeloid leukemia of the M4Eo
subtype. Two transcript variants encoding different isoforms have been found for this gene.
21.3 kDa

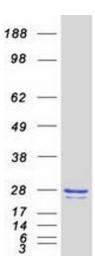

Molecular Weight:	21.3 kDa
NCBI Accession:	NP_001746
Pathways:	Regulation of Lipid Metabolism by PPARalpha

# **Application Details**

Application Notes:	Recombinant human proteins can be used for:
	Native antigens for optimized antibody production
	Positive controls in ELISA and other antibody assays
Comment:	The tag is located at the C-terminal.
Restrictions:	For Research Use only

## Handling

Concentration:	50 μg/mL		
Buffer:	25 mM Tris.HCl, pH 7.3, 100 mM glycine, 10 % glycerol.		
Storage:	-80 °C		
Storage Comment: Store at -80°C. Thaw on ice, aliquot to individual single-use tubes, and then re-free immediately. Only 2-3 freeze thaw cycles are recommended.			

## **Western Blotting**
