Background:	The protein encoded by this gene is a member of the transmembrane 4 superfamily, also
	known as the tetraspanin family. Most of these members are cell-surface proteins that are
	characterized by the presence of four hydrophobic domains. The proteins mediate signal
	transduction events that play a role in the regulation of cell development, activation, growth and

	motility. This encoded protein is a cell surface glycoprotein that is known to complex with
	integrins. It contributes to the transduction of CD2-generated signals in T cells and natural killer
	cells and has been suggested to play a role in growth regulation. Familial deficiency of this gene
	has been linked to an immunodeficiency associated with recurrent infectious diseases caused
	by bacteria, fungi and viruses. Alternative splicing results in multiple transcript variants.
