Alternative Name:	Cdc42 (CDC42 Products)
Background:	The protein encoded by this gene is a small GTPase of the Rho-subfamily, which regulates signaling pathways that control diverse cellular functions including cell morphology, migration,

endocytosis and cell cycle progression. This protein is highly similar to Saccharomyces

cerevisiae Cdc 42, and is able to complement the yeast cdc42-1 mutant. The product of

	oncogene Dbl was reported to specifically catalyze the dissociation of GDP from this protein.
	This protein could regulate actin polymerization through its direct binding to Neural Wiskott-
	Aldrich syndrome protein (N-WASP), which subsequently activates Arp2/3 complex. Alternative
	splicing of this gene results in multiple transcript variants. Pseudogenes of this gene have been
	identified on chromosomes 3, 4, 5, 7, 8 and 20.
