	tyrosine kinases. The encoded protein plays a role in macropinocytosis as a component of the
	WAVE2 complex, and also forms a complex with EPS8 and SOS1 that mediates signal
	transduction from Ras to Rac. This gene may play a role in the progression of several
	malignancies including melanoma, colon cancer and breast cancer, and a t(1011)
	chromosomal translocation involving this gene and the MLL gene has been associated with
	acute myeloid leukemia. Alternatively spliced transcript variants encoding multiple isoforms
	have been observed for this gene, and a pseudogene of this gene is located on the long arm of
	chromosome 14.
Molecular Weight:	51.7 kDa
NCBI Accession:	NP_001012770
