Target Details	
Target:	AIF (AIFM1)
Alternative Name:	Aifm1,aif (AIFM1 Products)
Background:	This gene encodes a flavoprotein essential for nuclear disassembly in apoptotic cells, and it is
	found in the mitochondrial intermembrane space in healthy cells. Induction of apoptosis results
	in the translocation of this protein to the nucleus where it affects chromosome condensation
	and fragmentation. In addition, this gene product induces mitochondria to release the

	apoptogenic proteins cytochrome c and caspase-9. Mutations in this gene cause combined
	oxidative phosphorylation deficiency 6 (COXPD6), a severe mitochondrial encephalomyopathy,
	as well as Cowchock syndrome, also known as X-linked recessive Charcot-Marie-Tooth
	disease-4 (CMTX-4), a disorder resulting in neuropathy, and axonal and motor-sensory defects
	with deafness and mental retardation. Alternative splicing results in multiple transcript variants.
	A related pseudogene has been identified on chromosome 10.
