	non-identical RNA recognition motifs and belongs to the hnRNP R family of RNA-binding
	proteins. It has been proposed that this complementation factor functions as an RNA-binding
	subunit and docks APOBEC-1 to deaminate the upstream cytidine. Studies suggest that the
	protein may also be involved in other RNA editing or RNA processing events. Several transcript
	variants encoding a few different isoforms have been found for this gene.
Molecular Weight:	64.8 kDa
