Background:	This gene encodes a member of the low density lipoprotein receptor (LDLR) family. Low density	
	lipoprotein receptors are cell surface proteins that play roles in both signal transduction and	
	receptor-mediated endocytosis of specific ligands for lysosomal degradation. The encoded

protein plays a critical role in the migration of neurons during development by mediating Reelin signaling, and also functions as a receptor for the cholesterol transport protein apolipoprotein E. Expression of this gene may be a marker for major depressive disorder. Alternatively spliced transcript variants encoding multiple isoforms have been observed for this gene.
