Target Details	
Target:	C4BPB
Alternative Name:	c4b-Binding Protein beta (C4BPB Products)
Background:	This gene encodes a member of a superfamily of proteins composed predominantly of
	tandemly arrayed short consensus repeats of approximately 60 amino acids. A single, unique

beta-chain encoded by this gene assembles with seven identical alpha-chains into the

predominant isoform of C4b-binding protein, a multimeric protein that controls activation of the	ì
complement cascade through the classical pathway. C4b-binding protein has a regulatory role	
in the coagulation system also, mediated through the beta-chain binding of protein S, a vitamin	
K-dependent protein that serves as a cofactor of activated protein C. The genes encoding both	
alpha and beta chains are located adjacent to each other on human chromosome 1 in the	
regulator of complement activation gene cluster. Alternative splicing gives rise to multiple	
transcript variants.
