Background:	In mammals, the Y chromosome directs the development of the testes and plays an important role in spermatogenesis. A high percentage of infertile men have deletions that map to regions of the X chromosome. The DAZ (deleted in azoospermia) gene cluster maps to the AZEC region

of the Y chromosome. The DAZ (deleted in azoospermia) gene cluster maps to the AZFc region

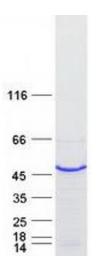

of the Y chromosome and is deleted in many azoospermic and severely oligospermic men. It is

	thought that the DAZ gene cluster arose from the transposition, amplification, and pruning of
	the ancestral autosomal gene DAZL also involved in germ cell development and
	gametogenesis. This gene encodes a RNA-binding protein with two RNP motifs that was
	originally identified by its interaction with the infertility factors DAZ and DAZL. Two isoforms are
	encoded by transcript variants of this gene.
