Background:	DEAD box proteins, characterized by the conserved motif Asp-Glu-Ala-Asp (DEAD), are putative RNA helicases. They are implicated in a number of cellular processes involving alteration of RNA secondary structure, such as translation initiation, nuclear and mitochondrial splicing, and ribosome and splicesosome assembly. Based on their distribution patterns, some members of

	this family are believed to be involved in embryogenesis, spermatogenesis, and cellular growth
	and division. This gene encodes a DEAD box protein, which is an ATPase activated by a variety
	of RNA species, but not by dsDNA. This protein, and that encoded by DDX5 gene, are more
	closely related to each other than to any other member of the DEAD box family. This gene can
	encode multiple isoforms due to both alternative splicing and the use of alternative translation
	initiation codons, including a non-AUG (CUG) start codon.
Molecular Weight:	80.1 kDa
