Background:	The protein encoded by this gene catalyzes the post-translational formation of 4-hydroxyproline
	in hypoxia-inducible factor (HIF) alpha proteins. HIF is a transcriptional complex that plays a
	central role in mammalian oxygen homeostasis. This protein functions as a cellular oxygen
	sensor, and under normal oxygen concentration, modification by prolyl hydroxylation is a key
	regulatory event that targets HIF subunits for proteasomal destruction via the von Hippel-

## Target Details
