Background:	Hemidesmosomes are structures which link the basal lamina to the intermediate filament
	cytoskeleton. An important functional component of hemidesmosomes is the integrin beta-4
	subunit (ITGB4), a protein containing two fibronectin type III domains. The protein encoded by

	this gene binds to the fibronectin type III domains of ITGB4 and may help link ITGB4 to the
	intermediate filament cytoskeleton. The encoded protein, which is insoluble and found both in
	the nucleus and in the cytoplasm, can function as a translation initiation factor and prevent the
	association of the 40S and 60S ribosomal subunits. Multiple non-protein coding transcript
	variants and variants encoding two different isoforms have been found for this gene.
