Target Details	
Target:	ERCC1
Alternative Name:	Ercc1 (ERCC1 Products)
Background:	The product of this gene functions in the nucleotide excision repair pathway, and is required for
	the repair of DNA lesions such as those induced by UV light or formed by electrophilic
	compounds including cisplatin. The encoded protein forms a heterodimer with the XPF
	endonuclease (also known as ERCC4), and the heterodimeric endonuclease catalyzes the 5'

	incision in the process of excising the DNA lesion. The heterodimeric endonuclease is also involved in recombinational DNA repair and in the repair of inter-strand crosslinks. Mutations in this gene result in cerebrooculofacioskeletal syndrome, and polymorphisms that alter expression of this gene may play a role in carcinogenesis. Multiple transcript variants encoding different isoforms have been found for this gene. The last exon of this gene overlaps with the CD3e molecule, epsilon associated protein gene on the opposite strand.
