Background:	This gene encodes a protein that is involved in the regulation of the actin cytoskeleton and cell
	shape. This protein contains an actin filament-binding domain, which together with its Dbl
	homology domain and one of its pleckstrin homology domains, can form microspikes. This
	protein can activate MAPK8 independently of the actin filament-binding domain, and it is also

	of CDC42 also enables this protein to play a role in mediating the cellular invasion of
	Cryptosporidium parvum, an intracellular parasite that infects the gastrointestinal tract.
	Mutations in this gene can cause Charcot-Marie-Tooth disease type 4H (CMT4H), a disorder of
	the peripheral nervous system. Multiple alternatively spliced transcript variants encoding
	different isoforms have been found for this gene.
