Abstract:	FLRT2 Products	
Background:	This gene encodes a member of the fibronectin leucine rich transmembrane (FLRT) family of	
	cell adhesion molecules, which regulate early embryonic vascular and neural development. The	
	encoded type I transmembrane protein has an extracellular region consisting of an N-terminal	
	leucine-rich repeat domain and a type 3 fibronectin domain, followed by a transmembrane

domain and a short C-terminal cytoplasmic tail domain. It functions as both a homophilic cell adhesion molecule and a heterophilic chemorepellent through its interaction with members of the uncoordinated-5 receptor family. Proteolytic removal of the extracellular region controls the migration of neurons in the developing cortex. Alternative splicing results in multiple transcript variants.
