Target Details

| Target: | GALE |

| Alternative Name: | Gale (GALE Products) |
| Background: | This gene encodes UDP-galactose-4-epimerase which catalyzes two distinct but analogous |
|  | reactions: the epimerization of UDP-glucose to UDP-galactose, and the epimerization of UDP-N- <br>  <br>  <br>  |
|  | the importylglucosamine to UDP-N-acetylgalactosamine. The bifunctional nature of the enzyme has |

|  | on exogenous galactose, but also on exogenous N -acetylgalactosamine as a necessary precursor for the synthesis of glycoproteins and glycolipids. Mutations in this gene result in epimerase-deficiency galactosemia, also referred to as galactosemia type 3 , a disease characterized by liver damage, early-onset cataracts, deafness and mental retardation, with symptoms ranging from mild (\&aposperipheral\&apos form) to severe (\&aposgeneralized\&apos form). Multiple alternatively spliced transcripts encoding the same protein have been identified. |
